

You have been creating a magic wizard coding project.

This is a sample of what your code should look like for part 1.

You need a start block other than the green flag to make the code for the magic. Each of the characters that disappear must have a show block with the green flag so that when the program starts all the characters are visible.

You may choose the characters you use. You may add a background. This project will not require any sounds. You may not add sounds. You do not need to paint your characters at this point in time. Focus on your coding.

For part 2 your challenge is to have the wizard make three different characters vanish. Remember the wizard must say the magic words to make a character disappear, and the wizard can only make one character disappear at a time. The code for making each character disappear will use a different start block, different magic words, and a different broadcast message.

For part 3 your challenge is to have the three characters reappear one at a time when the wizard says the magic words. The code for making each character reappear will use a different start block, different magic words, and a different broadcast message.

For part 4 you can add the change effects block to create different kinds of magic effects before the character vanishes. Add a wait after the change effect block.
